

the 1990s, the number of people in the world who are under 15 years of age has increased by 1.2 billion, from 1.1 billion in 1980 to 2.3 billion in 1999. The number of people aged 15 years and over has increased by 1.1 billion, from 1.1 billion in 1980 to 2.2 billion in 1999.

There are a number of reasons why the world population is growing so rapidly. One of the main reasons is that the number of children born to each woman has increased. In 1980, the average woman in the world had 4.7 children. In 1999, the average woman in the world had 5.1 children. This is due to a number of factors, including improved medical care, increased access to contraception, and a shift in cultural values.

Another reason why the world population is growing so rapidly is that the number of people who are surviving into old age has increased. In 1980, the average life expectancy in the world was 47 years. In 1999, the average life expectancy in the world was 52 years. This is due to a number of factors, including improved medical care, increased access to education, and a shift in cultural values.

There are a number of challenges that the world population growth poses. One of the main challenges is that the world's resources are being depleted at an alarming rate. This is due to a number of factors, including increased demand for food, water, and energy, and the impact of climate change. Another challenge is that the world's infrastructure is being strained by the increasing number of people.

There are a number of ways that the world population growth can be managed. One way is to improve the world's infrastructure, including roads, bridges, and public transportation. Another way is to improve the world's education system, so that people are better equipped to manage their resources. A third way is to improve the world's health care system, so that people are better able to survive into old age.
